The FARE FAITH Challenge is a global research competition created to develop a novel, safe and compassionate procedure for accurately diagnosing food allergies in children and adults. The new solution will replace the oral food challenge (OFC) as the best current method to diagnose or rule out food allergies.

- An estimated half a billion people suffer from food allergies worldwide. Globally, the foods causing most of the significant allergic reactions include peanut, tree nuts, finned fish, shellfish, milk, egg, wheat, soy, and seeds (commonly sesame).

- Food allergy reactions can vary unpredictably from mild to severe. Mild food allergy reactions may involve only a few hives or minor abdominal pain, though some food allergy reactions progress to severe anaphylaxis with low blood pressure and loss of consciousness.

- The OFC, when done in a double-blind and placebo-controlled fashion, is the current “gold standard” in diagnosing food allergies. It is a medical procedure in which a food is eaten slowly, in gradually increasing amounts, under medical supervision, to accurately diagnose or rule out a true food allergy.

- The OFC and related diagnostic tools, while generally safe, expose some patients to severe food allergy reactions, severe illness and even death. About two percent of patients in the U.S. experience anaphylaxis as a result of the test. In addition, an OFC can also have long-lasting impact on patient anxiety and mental health due to the physical duress and health risks involved with its application.

- The OFC stifles innovation and complicates care management because of the inability to accurately measure clinically relevant food allergy using an advanced, simple-to-administer test that is validated and regulatory agency-accepted. Clinical trials are limited or slowed, as are treatment plans for those impacted. There needs to be a better, simpler way to test for food allergies.
ABOUT THE FAITH CHALLENGE

- FARE created the FAITH Challenge to motivate the brightest research minds in the world to develop and validate a safe, compassionate, and accurate next-generation alternative to the OFC.

- Following an initial exploratory period, a $1 million (US) cash prize will be awarded to a team (or teams) to incentivize investigators to develop a new gold-standard diagnostic tool for food allergies. Teams demonstrating evidence of progress and presenting a compelling assay development plan will be eligible to receive additional incentive awards. These funds have been generously donated by individual and corporate benefactors, including FARE, Nestlé Health Science, the Carter Family, the Naddisy Foundation, the Trachte Family, the Hittman Family Foundation and an anonymous donor.

- FAITH seeks to bring together the world’s most insightful and creative researchers from food allergy and immunology, biopharma and healthcare. FARE also encourages others in adjacent disease research categories to join the FAITH Challenge.

- Research submissions will be reviewed, tracked and appraised by a panel of judges comprising experts in the fields of food allergy and immunology from both academia and the private sector.

- FAITH participation is not limited to U.S. investigators. Individuals and teams around the world are encouraged to form research consortia and compete for the awards.

- The FAITH Challenge begins in 2021, and the competition continues through 2024.
